What is Photoshop? With Photoshop, you can apply artistic effects to photographs, such as collages, photo manipulations, pattern overlays, and even some of the more advanced topics such as vector graphics. Adobe Photoshop offers two ways to edit an image, the interface and the command line. When editing an image in Photoshop, you can choose the interface that is most suitable for your needs. If you are looking for a quick, simple way to edit images, then the Photoshop GUI is the best way to begin. On the other hand, if you are looking to perform some serious image alterations, such as creating vector art or using the Paint Bucket tool to change a color, then you are better off using the command line interface, otherwise known as the Adobe Photoshop command-line interface or better yet, simply the command line. Adobe Photoshop has several tools for manipulating images which include: Layer: A tab in Photoshop that holds groups of layers and enables you to select only one layer at a time, or select several layers and apply a filter to just those layers. You can apply the selected filter to all layers or all layers but one. Layer Masks: An area in Photoshop that allows you to selectively apply a filter to selected areas on a layer. There is a difference between a layer mask and a layer transparency. A layer mask is an area around an image that is void of any color or tones, but is where you can apply a filter to (such as a blur filter) to give the filter an effect as though you were applying the filter to the layer directly. On the other hand, a layer transparency is a portion of a layer that allows certain colors to pass through, while the rest of the layer is retained as it is, allowing you to create interesting effects with the layer. Layer Group: A single combined layer of the layers on a layer, similar to layers. However, they can also be individually merged or split. You can apply filters to the entire group or different groups, the entire group or different groups but one, the entire group or just individual layers. Layers: A folder that holds any layers you create in Photoshop. These folders can have multiple layers or simply one layer, but again, can be organized individually or in a group. You can also apply filters to just the individual layers and groups of layers. Layers Styles: Styles provide options that allow you to quickly select which way the art is rendered. This

Hold a meeting with the participants List all the participants (and maybe have them bring their own travel expenses if they are on the road): 2. Ask them a question with a status attached, and change the status of the question (e.g. from red to yellow) 3. Then, we'll all see the status change, and all of us get a notification 4. When they view the status, they get some context from the question to adjust their opinion, and they can modify their opinion accordingly Let's see how it looks like in practice! My problem has to do with checking if a name was found in an array. So far, I've been trying the following, but I can't seem to get it to work. The array names come from an api, so they could be in any language. I just need to check that the name came back as true. Would someone please help? @name_array = ['robin', 'fred','steve'] @name_array.each do |name| if @us_names.name == name puts name puts @name_array.include?(name) end end A: In Ruby a method call returns either true or false. So in your example, the.name method call will return either true or false. But it won't return the name itself. To collect all of the names, use map: @us_names.names.map(&:name) This returns an array containing all of the names. You can then use all? to find out if the array contains any of those names: @us_names.names.all?(&:name) or @us_names.names.any?(&:name) Wasp is a family of large, metazoan insect and wasp species that show remarkable evolutionary
