Q: How to achieve java.lang.VerifyError exception in android? I am getting java.lang.VerifyError exception in my Android application What is the solution for this? A: The Cause of the Error. Probably you have checked a rater than you have written this code, and you have missed a certain code which could cause the Exception. The solution to this error is to make sure that every piece of code in your app is correctly written. I do not mean that you should make sure every single piece of code in your app is correct, but that every piece of code should be correct. "The app used to be OK when it was in the Market. Now, a month later, an unknown error has appeared. I guess that a bug appeared in an update, and an

older version would solve the problem. What can I do to fix it?" "If I have used some library code, it can cause the bug?" If you have written a bug then the only way to fix it is to make sure that the code is not a bug. If it is a bug then the easiest way to fix it is to change the code and get rid of the bug. "After some deep investigation, I have found the cause of the error, and a small modification in a Java class will fix the problem." "The code is really simple, but I have not known that this class was needed and I have not known about that Java class. Can I submit a pull request to the library to get rid of the class?" If you are lucky then you have found the cause of the error and you can use a quick fix to fix the problem. However, if you have not found a1d647c40b
